

EXERCICES DU CHAPITRE VI

On reprend l'exercice du chapitre IV sur le taux de salaire.

On étudie l'évolution du salaire horaire dans le secteur marchand.

TW le taux de croissance trimestriel du salaire horaire

TP le taux de croissance trimestriel de l'indice des prix à la consommation

TCHO le taux de chômage

TSMIC le taux de croissance du SMIC

DU821 une variable muette au premier trimestre 1982

1 La méthode de Engel et Granger pour l'équation de TW

Commençons par la construction d'E.G. dans le cas d'une équation où comme nous l'avons vu dans le chapitre précédent toutes les variables sont I(1) avec un trend pour TCHO.

On construit le modèle

$$TW = a_0 + a_1TCHO + a_2TP + a_3TSMIC + \epsilon$$

et on récupère les résidus de ce modèle RES ils vont estimer ϵ_{t-1} dans l'équation (9) du cours

On construit ainsi l'équation de court terme corrigée par le résidus de long terme précédent:

$$\Delta TW = b_0 + \gamma RES_{t-1} + b_1\Delta TCHO + b_2\Delta TP + a_3\Delta TSMIC + \epsilon$$

en ajoutant éventuellement des retards sur les Δ des variables qui ne servent qu'à obtenir un BB pour l'erreur.

Linear Regression - Estimation by Least Squares

1.1 Les erreurs du modèle sont-elles des Bruits Blancs?

1.2 Modèle à correction d'erreur

- Le résidu en t-1 du modèle de long terme est-il significatif ?
- Toutes les variables sont-elles significatives
- A-t-on construit un modèle à correction d'erreur ?

2 Modèles VAR à correction d'erreur :La méthode de Engel et Granger

On va essayer de reprendre les méthodes exposées dans le cours pour construire des modèles VAR à Correction d'Erreur

On aborde tout d'abord l'étude équation par équation de Engel et Granger puis des modèles à correction d'erreur conditionnels et enfin la méthode globale de Johansen.

Vous trouverez ci-dessous les quatre équations de E. G. correspondant aux quatre variables I(1). Le résidu en t-1 est le même pour les quatre équations c'est celui que nous avons construit dans la partie I.

Pour la première équation voir la partie I

2.1 Etude de chaque équation

Pour chaque équation étudier la méthode de Engel et Granger, c'est-à-dire regarder si le RES en t-1 est significatif.

- Remarquez que pour certaines équations on a du ajouter des retards sur les variables pour que l'erreur du modèle soit un BB

2.2 Conclusion

Conclure sur le rôle des variables.

Combien de modèles de Engel et Granger peut-on construire ?

3 MCE conditionnels

Pour chaque variable on construit l'équation (16) du cours en enlevant le trend s'il n'est pas significatif.

3.1 Etude de chaque équation

On reprend la page 8 du cours pour tester si la variable en t-1 est significative ou non avec pour chaque équation le trend seulement s'il est significatif et des retards si nécessaire pour avoir un BB.

On donne les bornes des tables d'Ericsson et MacKinnon :

pour un modèle sans trend : La borne $K_\alpha = -3,79$ avec $\alpha = 0,05$

pour un modèle avec trend : la borne $K_\alpha = -4,5$

3.2 Conclusion

Toutes les équations sont-elles des MCE conditionnels?

Comparer les résultats à la question 1.

4 Méthode générale de Johanson

4.1 Etude du VAR à correction d'erreur avec constante
